

# Field Services

## for electrical infrastructure

ENOSERV's commitment to invent, improve and integrate leading edge solutions is our cornerstone. Our software division led by technicians and power engineers has helped utility clients throughout North America accelerate and standardize O&M. Our customers and partners trust our expertise and employ our software tools to accept, commission, and maintain critical assets within their complex protection systems.

With years of experience in both generation and T&D, our Field Services Division has seen enough to demand quality in the equipment it inspects. Our team will either prove the proper performance of relays and associated equipment like breakers, CT's, PT's, cables and switchgear, or recommend solutions to remedy the problems before the equipment goes online.

ENOSERV utilizes the software automation it pioneered for the electric utility industry to efficiently outperform all testing methods used by most other service providers.

### **Commissioning & Start Up**

ENOSERV outperforms acceptance testing and commissioning according to the recommendation of NETA, ANSI, IEEE and manufacturer information leaflets. The end result is confidence that your new assets are ready to go online.

### **Facility Maintenance Testing**

Define, locate and correct. ENOSERV has the effective means to detect and evaluate anomalies that lead to equipment failure. Our technicians discern factors leading to potential equipment failure with high-tech instrumentation and test procedures. ENOSERV can help you correct and continuously improve your overall system performance by verifying your in-service equipment operates according to the design intent. Unscheduled down time is therefore minimized or eliminated. What results is a detailed analysis of your power system and the assurance that your assets perform as they should.

### **Substation Operation and Maintenance**

ENOSERV knows the most critical maintenance issues facing substation engineers. Utilities and substation owners seeking new strategies for improving the efficiency of energy distribution will benefit from ENOSERV's valuation and condition assessments.

*ENOSERV test procedures ensure a state of excellence in your facility. Equipment, processes and personnel functioning cohesively means a safer, more reliable & efficient operation. Focus on customer benefit is our approach to success.*
